October 21, 2021

HERE WE GO!

This is my learning notebook of Microeconomic Theory I (Course number: ECON601 at USC Economics). As one of the core courses in an economic Ph.D. curriculum, Microeconomic Theory I is beyond important to my research. Therefore, I would love to use this notebook as a commitment mechanism, to document lecture notes, discuss session and office hour intuitions, reading summaries, my personal questions regarding the topics and more. By building a file from scratch, hopefull I could have a more systematic and sophisticated understanding on the content of this course.

I thank Prof. Jonathan Libgober at USC Economics for leading the discussion of the course and providing intuitive ways to understand microeconomic theory. Please check his webpage here, he is such fun.

I also appreciate the time and effort my TA Qitong Wang put into this course, guiding me through discussing sessions and problem sets. When I have questions, he is always there to help.

Following the structure of the course, this notebook will cover three aspects of microeconomic theories: (a) individual decision making, (b) game theory, (c) mechanism design and contract theory. Apart from Jonathan's lecture notes, I will also summarize the reading materials, including: Mas-Colell et al. (1995)'s *Microeconomic Theory*, Mailath (2018)'s *Modelling Strategic Behavior*[1], Fudenberg and Tirole (1991)'s *Game Theory*, Myerson (1991)'s *Game Theory: Analysis of Conflicts*, Bolton and Dewatripont (2005)'s *Contract Theory*, Mailath and Samuelson (2006)'s *Repeated Games and Reputation* and Osborne and Rubinstein (1994)'s *A Course in Game Theory*. Other materials will also be referred to along the way.

Building this notebook is truly a memorable journey for me. I would love to share this review and all the related materials to anyone that finds them useful. And unavoidably, I would make some typos and other minor mistakes (hopefully not big ones). So I'd really appreciate any correction. If you find any mistakes, please send the mistakes to this email address saizhang.econ@gmail.com or start a branch on Github. BIG thanks in advance!

Individual Decision Making

CHAPTER 1

PREFERENCES AND CHOICES, UTILITIES

Contents

1.1 Preference Relations 6
1.2 Choice Rules 9
1.3 Linking Preferences with Choices 9
1.4 Introducing Utility 9
1.5 Commentary 9

The first chapter summarizes the basic setting of individual decision making: preferences, choices and utilities. The main reference is Chapter 1 of Mas-Colell et al. (1995).

In this chapter, we will focus on 3 domains:

choice	given a set A, what choice from A is made
preference	given alternatives x, y, which does the decision maker prefers
utility	given an object X, how much does the DM likes X (as a number)

The starting point of individual decision problem is a *set of possible (mutually exclusive) alternatives* from which the individual must choose. To model decision making process on this set of alternatives, one can:

- either start from the tastes, i.e., *preference relations* of individuals, and set up the patterns of decision making with preferences
- or, start from the actual actions of individuals, i.e. *choices*, to deduct a pattern of decision making

With this two major approaches in mind, we know what's coming: the ***rationality*** of preferences and the central assumption of choices, the ***Weak Axiom of Revealed Preference (WARP)***. And of course, the two approaches and two basic assumptions are parallel, so we need to figure out how link the (underlying) preferences and (observed) choices.

1.1 Preference Relations

We start from the basic: *weak preference relation*, $\succsim$.

Definition 1.1.1: weak preference $\succsim$

A weak preference relation $\succsim$ on a set X is a subset of $X \times X$. If $(x, y) \in \succsim \Rightarrow x$ is at least as good as y, written as $x \succsim y$

A weak preference relation will induce two other types of relations on X:

Definition 1.1.2: strict preference $\succ$ and indifference $\sim$

With $\succsim$ defined by Def. 1.1.1, we have

- the *strict preference relation*, $\succ$ can be induced from $\succsim$ as: $x \succ y \Leftrightarrow x \succsim y \wedge y \not\succsim x$, or in words, x if preferred to y.
- the *indifference relation*, $\sim$ can be induced from $\succsim$ as: $x \sim y \Leftrightarrow x \succsim y \wedge y \succsim x$, or in words, x is indifferent to y.

With the definition of these relations, we now define the central assumption of relations: ***rationality***.

Definition 1.1.3: Rationality of $\succsim$

A weak preference relation $\succsim$ is *rational* if it is:

- Complete: $\forall x, y \in X, x \succsim y$ or $y \succsim x$ or both
- Transitive: $\forall x, y, z \in X, x \succsim y \wedge y \succsim z \Rightarrow x \succsim z$

How to understand them? They are both strong assumptions:

- Completeness of $\succsim$ means it is well-defined between any two possible alternatives. From the perspective of an individual, completeness means that she will make choices, and only meditated choices.
- Transitivity of $\succsim$ implies that the decision maker will not have a preference cycle, since whoever has a preference cycle would suffer economically for it[1].

With the definition of rational $\succsim$ in Def. 1.1.3, we can prove the following properites of $\succ$ and $\sim$ *induced* by $\succsim$:

[1]There are 2 types of violations of transitivity: irrational and mechanical. Irrational violations are easy to understand: decision makers simply do not follow transivity assumption, many reasons have been raised, including mental account, framing, menu effect, attraction effect, etc. Mechanical violations means that decision makers are "forced" to violate transitivity. One example of this type of violation is aggregation of considerations: decision makers may aggregate several sub-preferences as together to make the choice, leading to violation of transitivity. Another example is when the preference is only defined for differences above a certain level (problem of perceptible differences). See Mas-Colell et al. (1995, Page 7-8), Rubinstein (2012, Page 4-5) for details

Theorem 1.1.4: Properties of $\succ$ and $\sim$

If $\succsim$ is rational, then:

i. $\succ$ is irreflexive ($x \succ x$ never holds) and transitive ($x \succ y \wedge y \succ z \Rightarrow x \succ z$)

Proof:

- irreflexive: by Def. 1.1.2, $x \succ x \Rightarrow x \succsim x \wedge x \not\succsim x$, self contracdiction.
- transitive: $x \succ y \Rightarrow x \succsim y \wedge y \not\succsim x$, $y \succ z \Rightarrow y \succsim z \wedge z \not\succsim y$. By transitivity of $\succsim$, $x \succsim y \wedge y \succsim z \Rightarrow x \succsim z$. If $z \succsim x$, by transitivity of $\succsim$ and $x \succsim y$, we would have $z \succsim y$, contradicting $y \succ z$. Therefore $x \succsim z \wedge z \not\succsim x \Rightarrow x \succ z$.

ii. $\sim$ is reflexive ($x \sim x, \forall x$), transitive ($x \sim y \wedge y \sim z \Rightarrow x \sim z$) and symmetric ($x \sim y \Rightarrow y \sim x$)

Proof:

- reflexive: by completeness of $\succsim$, $\forall x, x \succsim x \Rightarrow x \sim x$
- transitive: $x \sim y \Rightarrow x \succsim y \wedge y \succsim x$, $y \sim z \Rightarrow y \succsim z, z \succsim y$, by the transitivity of $\succsim$, we have $x \succsim z \wedge z \succsim x$, hen $x \sim z$
- symmetric: $x \sim y \Rightarrow x \succsim y \wedge y \succsim x \Leftrightarrow y \succsim x \wedge x \succsim y \Rightarrow y \sim x$

iii. $x \succ y \succsim z \Rightarrow x \succ z$

Proof: $x \succ y \Rightarrow x \succsim y \wedge y \not\succsim x$, hence $x \succ y \succsim z \Rightarrow x \succsim z$. If $z \succsim x$, by transitivity of $\succsim$, $y \succsim x$, contradicting $x \succ y$. Therefore, $z \not\succsim x$

We can also directly define a *rational* $\succ$ (see Kreps (1990, Page 19-21)):

Definition 1.1.5

A strict preference ralation $\succ$ is rational if it is:

- asymmetric: $\nexists x, y \in X$ s.t. $x \succ y \wedge y \succ x$
- negatively transitive: $x \succ y \Rightarrow \forall z \in X \setminus \{x, y\}, x \succ z \vee z \succ y \vee$ both.

With Def. 1.1.5 and Def. 1.1.3, we can prove that $\succsim$ is rational iff $\succ$ is rational:

Theorem 1.1.6

$\succsim$ is rational $\Leftrightarrow$ $\succ$ is rational, specifically:

- $\succsim$ is complete $\Leftrightarrow$ $\succ$ is asymmetric
- $\succsim$ is transitive $\Leftrightarrow$ $\succ$ is negatively transitive

Now we prove this theorem:

Step 1 proof $\succsim$ is rational $\Rightarrow$ $\succ$ is rational

- **asymmetric**

  if $\exists x, y$ s.t. $x \succ y$ and $y \succ x$, then by the definition of induced strict preference, the pair x, y must satisfy

$$\begin{cases} x \succsim y \text{ and } y \not\succsim x & (x \succ y) \\ y \succsim x \text{ and } x \not\succsim y & (y \succ x) \end{cases}$$

  which is, by completeness of rational $\succsim$, impossible. Therefore, such pair x, y don't exist. $\succ$ is proved to be asymetric.

- **negatively transitive**
  First, $\forall z \notin \{x, y\}$, by completeness of rational $\succsim$, the relation between x and z is either $x \succsim z$ or $z \succsim x$. Similarly, the relation between y and z is either $y \succsim z$ or $z \succsim y$.
  Second, given $x \succ y$, x, y satisfies $x \succsim y$ and $y \not\succsim x$.
  Also, it is easy to prove that: $x \succ y \wedge y \succsim z \Rightarrow x \succ z$, $x \succ y \wedge z \succsim x \Rightarrow z \succ y$; and $x \succ y \wedge z \sim x \Rightarrow z \succ y$, $x \succ y \wedge y \sim z \Rightarrow x \succ z$
  Now we have the following scenarios:
  1. if $z \succsim x$ and $y \succsim z$, by transitivity of rational $\succsim$, $y \succsim x$, contradicting the definition of $x \succ y$. This scenario doesn't exist.
  2. if $x \succsim z$ and $y \succsim z$, since $x \succ y$, with the auxilary result proved above, we have $x \succ z$
  3. if $z \succsim x$ and $z \succsim y$, since $x \succ y$, with the auxilary result proved above, we have $z \succ y$
  4. if $x \succsim z$ and $z \succsim y$, since $x \succ y$, suppose:
     (a) $z \succsim x$ as well, then $x \sim z$, in this case $z \succ y$;
     (b) $z \not\succsim x$, then $x \succ z$
     (c) $y \succsim z$ as well, then $y \sim z$, in this case $x \succ z$
     (d) $y \not\succsim z$, then $z \succ y$
     therefore, a complete summary of (a) to (d) would give:

	$z \succsim x$	$z \not\succsim x$
$y \succsim z$	$z \succ y$ & $x \succ z$	$x \succ z$
$y \not\succsim z$	$z \succ y$	$x \succ z$ & $z \succ y$

  Combining all above, we have proved negative transitivity of $\succ$.

With asymmetry and negative transitivity proved, we've proved that $\succsim$ is rational $\Rightarrow \succ$ is rational

Step 2 proof $\succ$ is rational $\Rightarrow \succsim$ is rational.

- Complete: with a rational $x \succ y$, we know $\nexists x, y$ s.t. $x \succ y$ and $y \succ x$ by asymmetry. Therefore, $\forall x, y$, we have two possibilities.
  - $x \succ y$ and $y \not\succ x$, which would naturally induce a weak preference $x \succsim y$
  - $y \succ x$ and $x \not\succ y$, which would naturally induce a weak preference $y \succsim x$

  therefore, $\forall x, y$, either $x \succsim y$ or $y \succsim x$ completeness of $\succsim$ is proven.
- Transitive: with a rational $x \succ y$, negative transivity gives $\forall z \notin \{x, y\}$, either $x \succ z$, $z \succ y$, or both. By negative transitivity, we have:
  - $x \succ z$: following same procedure, we know $x \succsim z$. If:
    * $y \succsim z$, since $x \succ z \Rightarrow z \not\succsim x$, by completeness we have $x \succsim z$, thus $x \succsim y \wedge y \succsim z \Rightarrow x \succsim z$
    * $z \succsim y$, since $x \succ y \Rightarrow x \not\succsim y$, by completeness we have $x \succsim y$, thus $x \succsim z \wedge z \succsim y \Rightarrow x \succsim y$
  - $z \succ y$: again, we know $z \succsim y$. If:
    * $x \succsim z$, since $x \succ y \Rightarrow y \not\succsim x$, by completeness we have $x \succsim y$, thus $z \succsim y \wedge x \succsim z \Rightarrow x \succsim y$

* $z \succsim x$, with $x \succsim y$, suppose $y \succsim z$, this contradicts $z \succ y$, thus $z \succsim x \wedge x \succsim y \Rightarrow z \succsim y$
- $x \succ z$ and $z \succ y$: again we know $x \succsim z$ and $z \succsim y$. Suppose $y \succsim x$, this contradicts $x \succ y$, therefore $x \succsim z \wedge z \succsim y \Rightarrow x \succsim y$

In all three scenarios, transitivity is proved.

With completeness and transitivity proved, we've proved that $\succ$ is rational $\Rightarrow \succsim$ is rational.

Notice that negative positivity in Def. 1.1.5, is logically equivalent to its *contrapositive*: $\exists z \in X \setminus \{x, y\}$ s.t. $x \not\succ z \wedge z \not\succ y \Rightarrow x \not\succ y$. This is percisely why the definition is called negative transitivity.

1.2 Choice Rules

1.3 Linking Preferences with Choices

1.4 Introducing Utility

1.5 Commentary

For the content of this chapter, my main reference is Chapter 1 of Mas-Colell et al. (1995). Section 1, Chapter 2 of Kreps (1990) covers similar content but starts from strict preference $\succ$, it is a very good complement to Mas-Colell et al. (1995). Chapter 1 of Kreps (2013) explores choice and preferences on infinite sets. Lecture 1-3 of Rubinstein (2012) give a well organized, lecture-structured summary of these contents, it is a very good read.
